

Soft Tissue Anomalies

Introduction and Survey Results

Susan Makris

Prenatal Developmental Toxicity Study

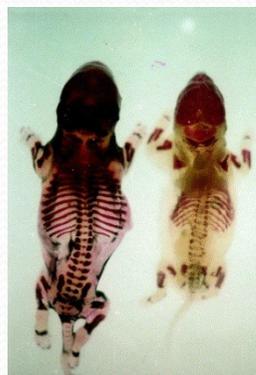

OPPTS 870.3700; OECD 414

Embryo-Fetal Developmental Toxicity Study

ICH S5(R2)

- **Exposure** of dams during major period of fetal organogenesis or during entire duration of gestation
- **Laparohysterectomy** conducted immediately prior to expected day of parturition
- **Maternal evaluation:**
 - Clinical observations
 - Body weight, food consumption, and/or water consumption
 - Necropsy findings
 - Macroscopic pathology
 - Ovarian corpora lutea counts
 - Non-reproductive organ weights are optional
 - Evaluation of gravid uterus
 - Gravid uterine weight
 - Implantation status
 - Counts (live, dead, early and late resorptions, empty implantation sites)
 - Placement in uterine horns
 - Examination of placental and amniotic fluid
- **Fetal evaluation:**
 - Fetal sex
 - External examination
 - Visceral (soft tissue) examination
 - Skeletal examination

Typical Methods for Soft Tissue Evaluation

- Selection of fetuses for soft tissue evaluation (per guidelines)
 - 50% of litter for rodents
 - 100% of litter for rabbits
- Wilson's technique (serial section)
 - Fetuses are preserved and decalcified in Bouin's solution
 - Head
 - Cervical, thoracic, and abdominal organs
 - May alternatively be dissected post-fixation
- Staples technique (fresh dissection)
 - Cervical, thoracic, and abdominal organs examined in situ
 - Staples dissection of heart
 - Head
 - Removed, preserved/decalcified in Bouin's solution, then serial sectioned
 - Optional single coronal section of rabbit heads to visualize internal brain morphology

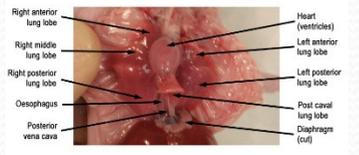

Soft Tissue Evaluation

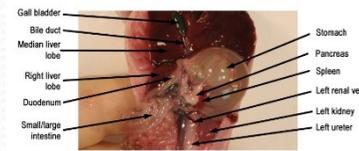

Ventral cervical region - main structures

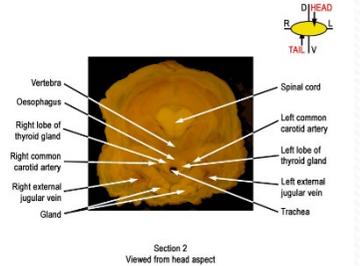

Heart examination - features of left ventricle

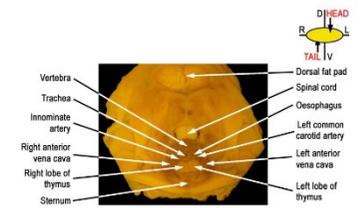

Thoracic cavity - lobulation of lungs

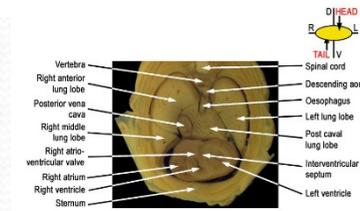

Abdominal viscera

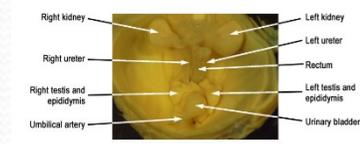

Section 2 Viewed from head aspect

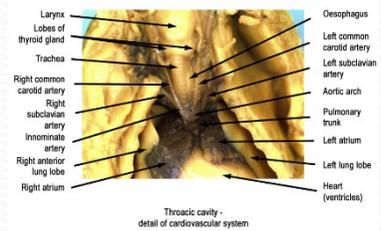

Section 7 Viewed from head aspect

Section 13 Viewed from head aspect

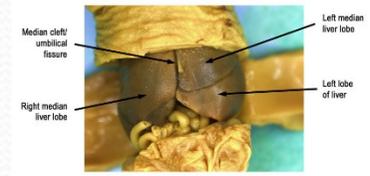

Male body wall section viewed from ventral aspect

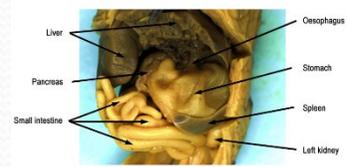

Thoracic cavity - detail of cardiovascular system

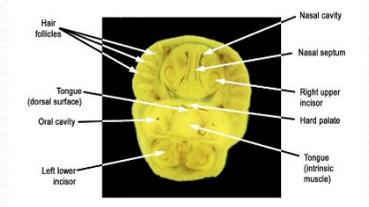

Heart - first section

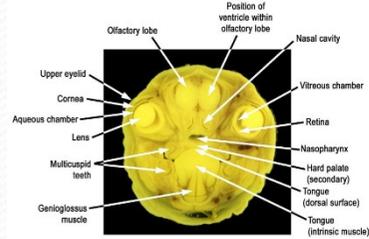

Liver - diaphragmatic aspect

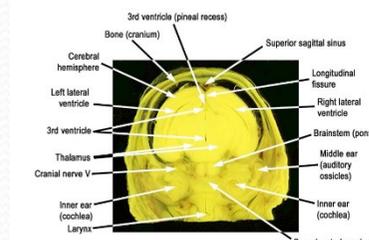

Abdominal contents - digestive tract

Section 2 Occipital view

Section 7 Occipital view

Section 10 Occipital view

History: 4th Workshop Soft Tissue Survey (2002)

- Index of agreement (IA) = $(M-V)/(M+V+U) \times 100$
- Visceral findings: **low agreement** observations discussed
 - Low agreement for M or V (equal numbers)
 - More than 1/3 (>7) respondents answered U or N
- Observations categorized as:
 1. **Number** (e.g., absent, supernumerary, doubled)
 2. **Shape** (e.g., misshapen, defect, cyst, etc.)
 3. **Location** (e.g., malpositioned, transposed, etc.)
 4. **Size** (e.g., size descriptor, small/enlarged, narrow/dilated, elongated/distended/short)
 5. **Color** (e.g., discoloration as consequence of functional impairment)

History: 4th Workshop Soft Tissue Survey (2002)

Conclusions for visceral observations

- There was high agreement for M or V determination for only a few observations
- Low agreement observations should remain in the Gray Zone, with the decision to classify as M or V dependent on:
 1. Severity
 2. Historical control data
 3. Occurrence in isolation
 4. Difficulty in determining relationship with an abnormal process
- A new category of “Not Malformation” (Unclassified) was agreed upon for visceral functional changes

8th Workshop Soft Tissue Survey

- 280 individual soft tissue findings
- Version 2 terminology
- Also included species other than rodent and rabbit (primate)
- Coded responses:
 - Malformation, Variation, Unknown, or Grey Zone
 - For Gray Zone findings: Grade, Severity, Persistence
- 18 respondents
- Agreement indices calculated:
 - $IA = (M-V)/(M+V+U+G) \times 100$
 - **$IA = (M-V)/(M+V+G) \times 100$**

8th Workshop Soft Tissue Survey

- **Agreement indices** on M or V classification
 - +75-100: 68
 - +50-74: 53
 - +0-49: 94
 - -0-49: 51
 - -50-74: 13
 - -75-100: 1
- **Good agreement** on M or V classification ($IA \geq 75\%$)
 - Malformations: 68 (+100%: 31)
 - Variations: 1 (-100%: 1)
- **Poor agreement** on M or V classification ($IA \leq 25\%$)
 - Malformations: 55
 - Variations: 19

$$IA = (M-V)/(M+V+G) \times 100$$

8th Workshop Soft Tissue Survey

- **Low agreement** for M or V classification:
 - Equal no. of respondents classifying finding as M or V: 5
 - More than 1/3 respondents (>6) classifying finding as Unknown: 7

8th Workshop Soft Tissue Survey

- Findings with **Low agreement** for M or V classification:
 - Equal no. of respondents classifying finding as M or V: 5
 - Esophagus – dilated
 - Gallbladder – bilobed
 - Intestine – cyst
 - Thorax – fluid-filled
 - Intestinal wall - thick

8th Workshop Soft Tissue Survey

- Findings with **Low agreement** for M or V classification (cont.):
 - More than 1/3 respondents (>6) classified finding as Unknown: 7
 - Common carotid trunk – present
 - Inner ear - discolored
 - Inner/middle ear – discolored
 - Gum (periodontium) – discolored
 - Aqueous chamber/humor – fluid-filled
 - Inner ear – red material
 - Inner/middle ear – red material

8th Workshop Soft Tissue Survey

- Proposal from 4th Workshop: classification as “Not Malformation” (Unclassified)
 - Findings that are likely consequences of functional disorder
 - More severe than a variation due to health impact on offspring
- “Unclassified” note in current survey findings (mostly variations)
 - +75-100: 0/68
 - +50-74: 0/53
 - +0-49: 4/94
 - -0-49: 37/51
 - -50-74: 8/13
 - -75-100: 0/1

8th Workshop Soft Tissue Survey

- “Not Malformation” (Unclassified) observations
 - Discolored
 - Red material
 - Altered texture
 - Consistency
 - Fluid-filled
 - Blood-filled (pericardium)

8th Workshop Soft Tissue Survey

- For Gray Zone anomalies, Grade was most often selected as the additional information needed
 - +75-100: (60, 0, 0)/69
 - +50-74: (146, 29, 1)/159
 - +0-49: (431, 170, 3)/547
 - -0-49: (217, 14, 0)/349
 - -50-74: (25, 1, 1)/64
 - -75-100: (0, 0, 0)/0

Sum scores: (Grade, Size, Persistence)/Gray Zone
