Stakeholder engagement at RIVM

Why do we do it and what is the quality of current activities?

Jeroen Devilee

Stakeholder engagement at RIVM | 2 june 2016

Social amplification of risk (2009-2011)

- Large industrial fire in a warehouse for chemicals at Moerdijk. Social amplification of risk by traditional media and jokes by cartoonists.

- Vaccination of 15 year old girls against HPV. Social amplification by social media. Impact on effectiveness of campaign.

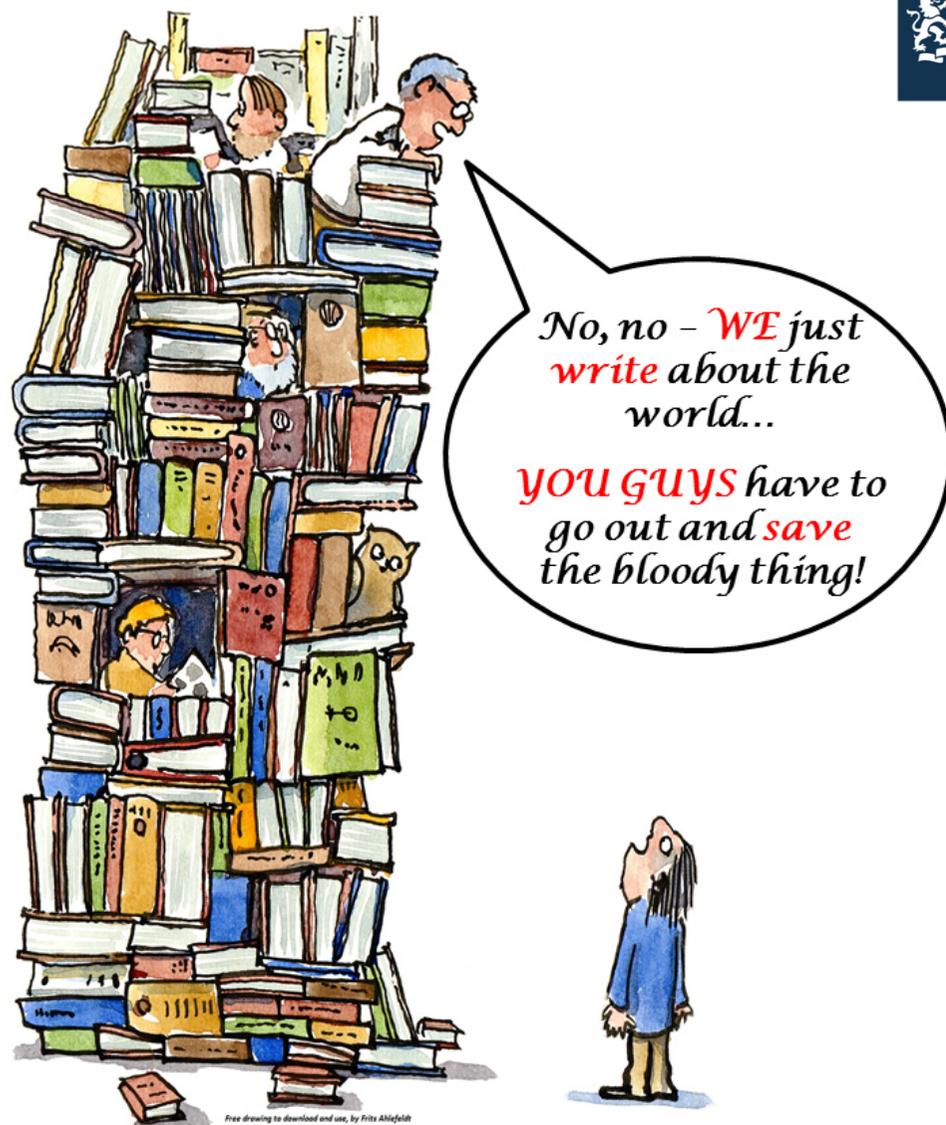

Impact on RIVM2020 strategy

- 'RIVM firmly embedded in society'. Includes:
 - More stakeholder engagement
 - More social sciences
 - A project on societal dialogue (Grenelle)
- In this Grenelle project different activities found their basis:
 - A stakeholder dialogue on graphene (nano)
 - A dialogue with the general public on new technologies
 - A self-assessment of the quality of different types of stakeholder engagement at RIVM (this presentation)

Contents

1. Intro (done that)
2. Quality of RIVM SE
3. But, why do we do it?
4. Deliberation in practice
5. Community of Practice (COP)

Self Assessment of quality of SE

Inventory of cases

- By asking the managers of the three RIVM domains (Safety & Environment, Public Health, Infectious Diseases)
- No 'old school, we already do this for ages' activities
- Between 2010 and 2015
- Organized (or at least a part) by RIVM

explore

Results of the inventory

Domain	#	Type of activity
CIB	4	Interview, enquête
V&Z	22	Interview, enquête, focus group, workshop, citizen science, action research
M&V	28	Interview, enquête, focus group, workshop, citizen science, advice committee, knowledge platform, joint committee
Total	54	9

Selection of 12 diverse RIVM cases

Domain	Project	Type activity
V&Z	Public Health Future Exploration 2014	Focus group
V&Z	Public health screening bowel cancer	Focus group
V&Z	Network Plus	Focus group
V&Z	Off label	Focus group
V&Z	Action supporting research	Action planning
V&Z	Healthy Slotermeer	Citizen science
M&V	Knowledge platform wind energy	Focus group
M&V	Chrome containing paint and CARC	Focus group
M&V	Knowledge network Biocides	Workshop
M&V	Development RIVM smartphone app	Workshop
M&V	Pesticides and residents	Advisory committee
CIB	Lice at home	Enquête

Assessment by 8 criteria (Reed, 2008)

- Clear goal of the activity and consensus about this goal among stakeholders
- Conditions that stimulate fairness, trust and mutual understanding
- A stakeholder analysis has been executed
- A fit for purpose method for engagement has been chosen
- Timing (as early as possible and en continuous during the proces)
- High quality facilitation
- Both scientific and lay, local and traditional knowledge has been used
- Structural embedding in the organisation

Reed MS. 2008. Stakeholder participation for environmental management: a literature review. *Biol Cons*, 141 (10): 2417.

Conclusions

- Strong points:
 - Clear goal of the activity and consensus about this goal among stakeholders
 - Conditions that stimulate fairness, trust and mutual understanding
- Possibilities to improve:
 - Do more and better stakeholder analyses
 - Acknowledge and appreciate stakeholders (don't drop them)
 - Invest in the skills of facilitators
 - Bundle and share knowledge on stakeholder engagement

But, why do we do it?

- 'I need to':
 - no stakeholder engagement will mean that I will not get funding for my proposal from our strategic research budget

or

But, why do we do it? (2)

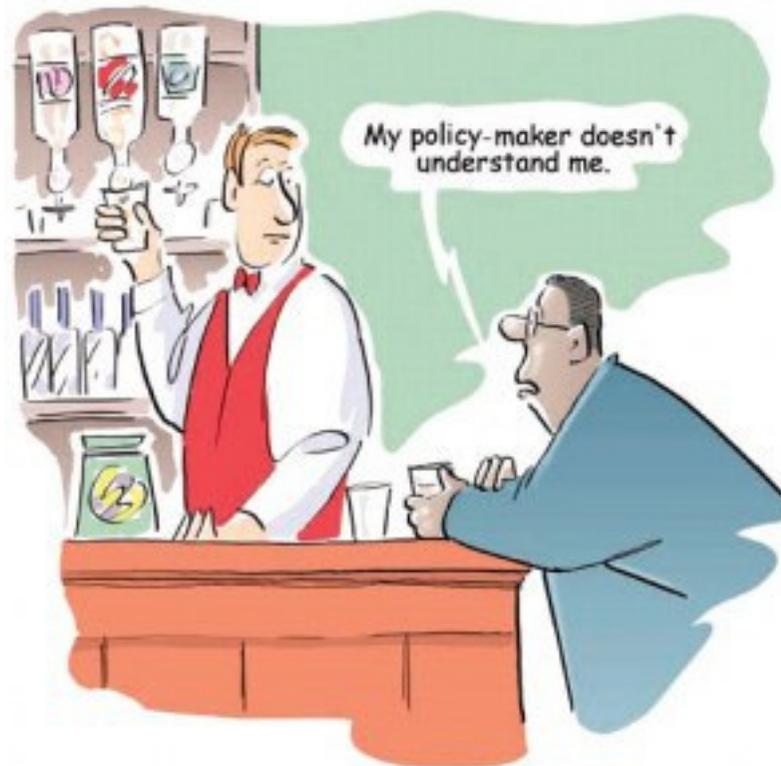

- Responsible Research and Innovation:
 - Improve quality of products and communication by triangulation of different perspectives
 - Open up the research process to build on legitimacy, support, trust

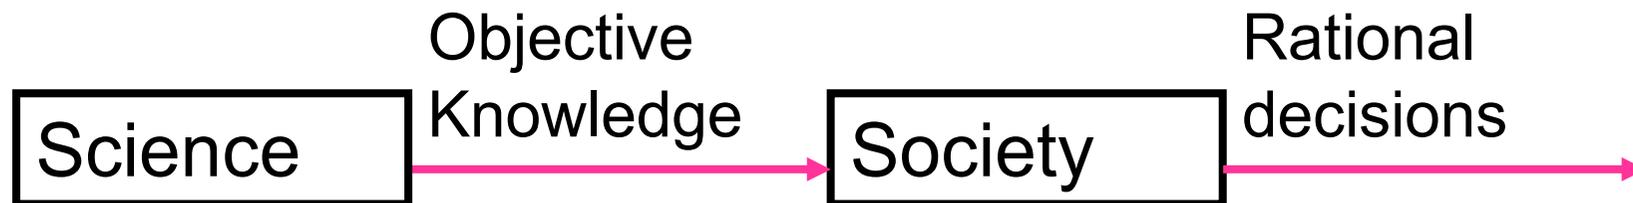

But, why do we do it? (3)

- Changing perspectives on the science-policy interface:
 - Expert roles: from science arbiter to participatory expert

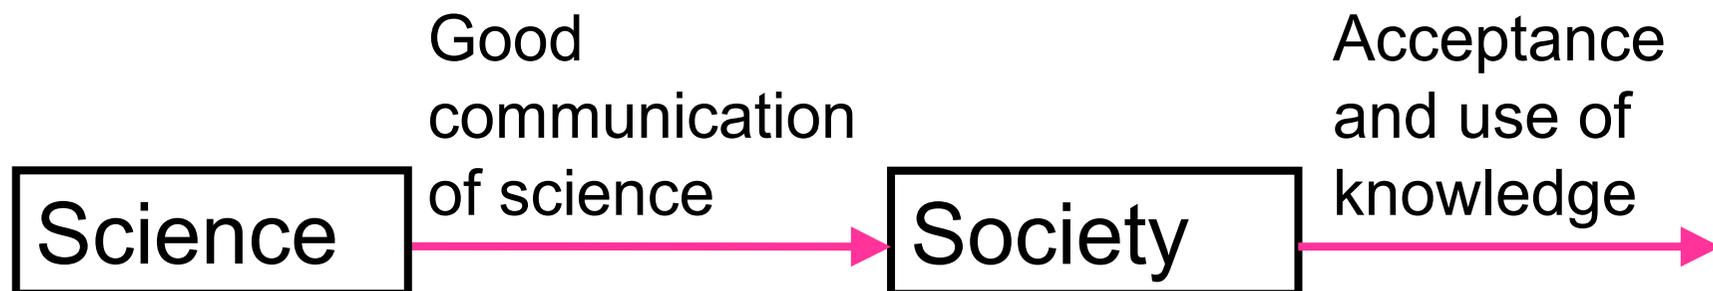

The linear model

- Science and society are seen as separate
- Fact/value dichotomy
- Societal benefits optimized by leaving science alone

Its twin: the information deficit-model

Problems with these models

Knowledge does not simply translate into action

- Uncertainties
- Competing and contested knowledge claims (ambiguity)
- Knowledge needs translation to be usable (which can never be neutral)

Knowledge production and policy making are entwined

- Science is not produced prior to and separate from societal concerns (coproduction)
- Fact value dichotomy is untenable

Problems with these models (2)

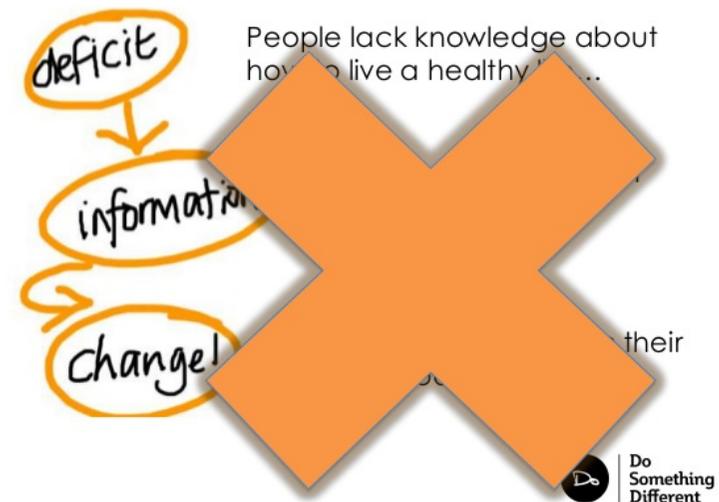

They make knowledge far too important

- Decision making has to take into account a wide variety of factors
- The lack of information is not the cause of seemingly irrational decisions

Bottom line

If lack of knowledge is not the problem, more knowledge or better communication are not the solution

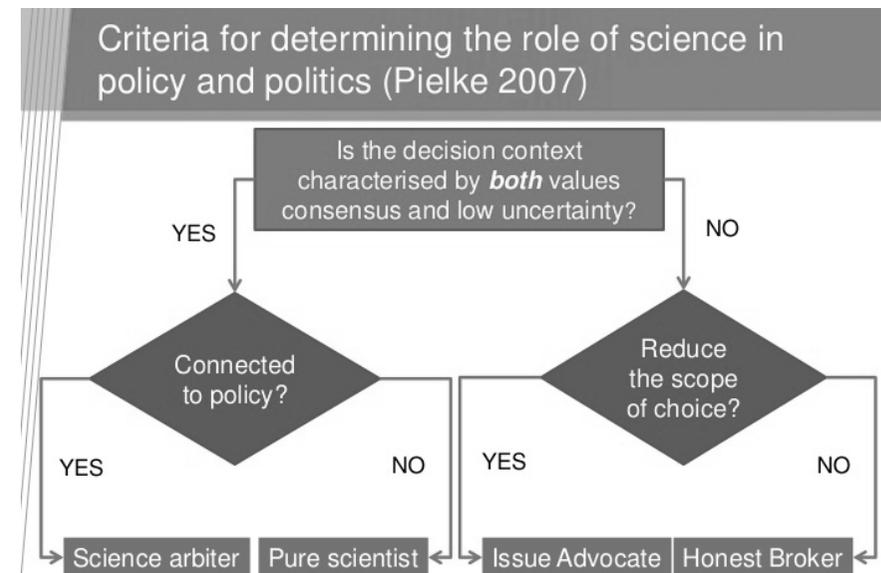

Behaviour change has been dominated by the information deficit model:

Risk institutes often act as a science arbiter

- Policy questions answered by means of knowledge based solutions
- Relatively strict separation between science and decision making
- Limited interaction with decision makers to learn about their needs, produce relevant knowledge and communicate this knowledge
- Often relatively well structured problems
- Consensus about values, about the relevance of scientific information to address the issue, and about the kind of knowledge required

And even science arbiters are not neutral!

- The uncritical acceptance of dominant framings may be safe but is not neutral
- An element of advocacy can not be avoided¹
- In a way, to be policy relevant is to be policy prescriptive
- Taking a stand against dominant framings can be legitimate and crucial for a functioning democracy (but risky)

¹Huitema, Turnhout, 2009. Working at the science-policy interface: A discursive analysis of boundary work at the Netherlands environmental assessment agency. Environmental Politics

But wicked problems ask for participatory experts

Brokers (Pielke)

- Including multiple perspectives
- Providing policy makers with options
- Intensive interaction with a variety of stakeholders to jointly define the problem, formulate questions, and develop knowledge

Participatory experts (Turnhout)

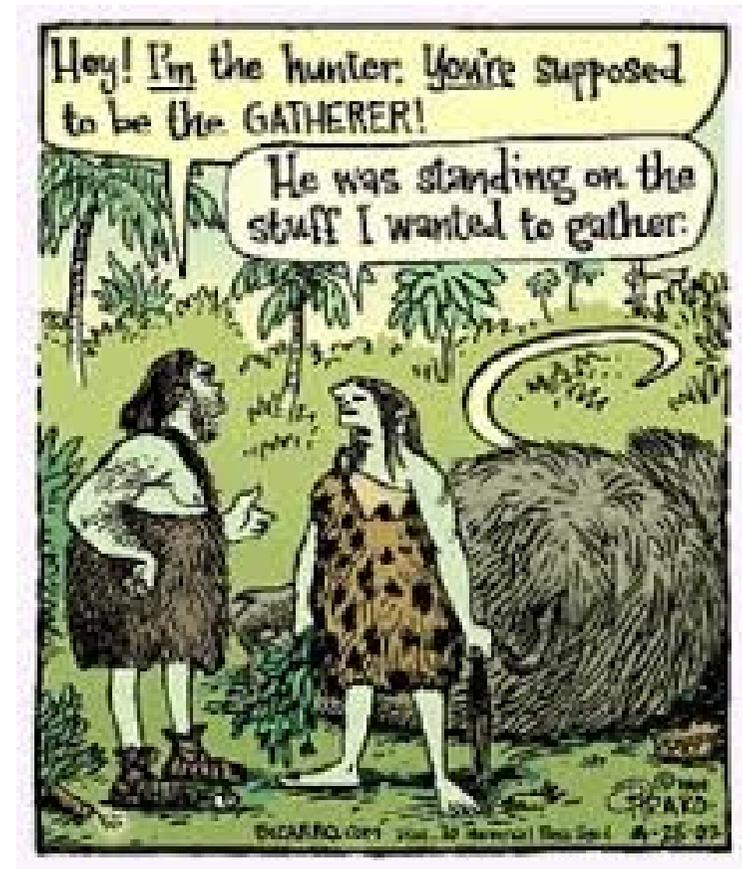

- Do not separate knowledge production and knowledge use
- Abandoning the linear model
- Recognize that scientific knowledge alone is not sufficient
- Acknowledge and value lay, local, or experiential knowledge (not as values, or perspectives, but as knowledge)

Deliberation in practice

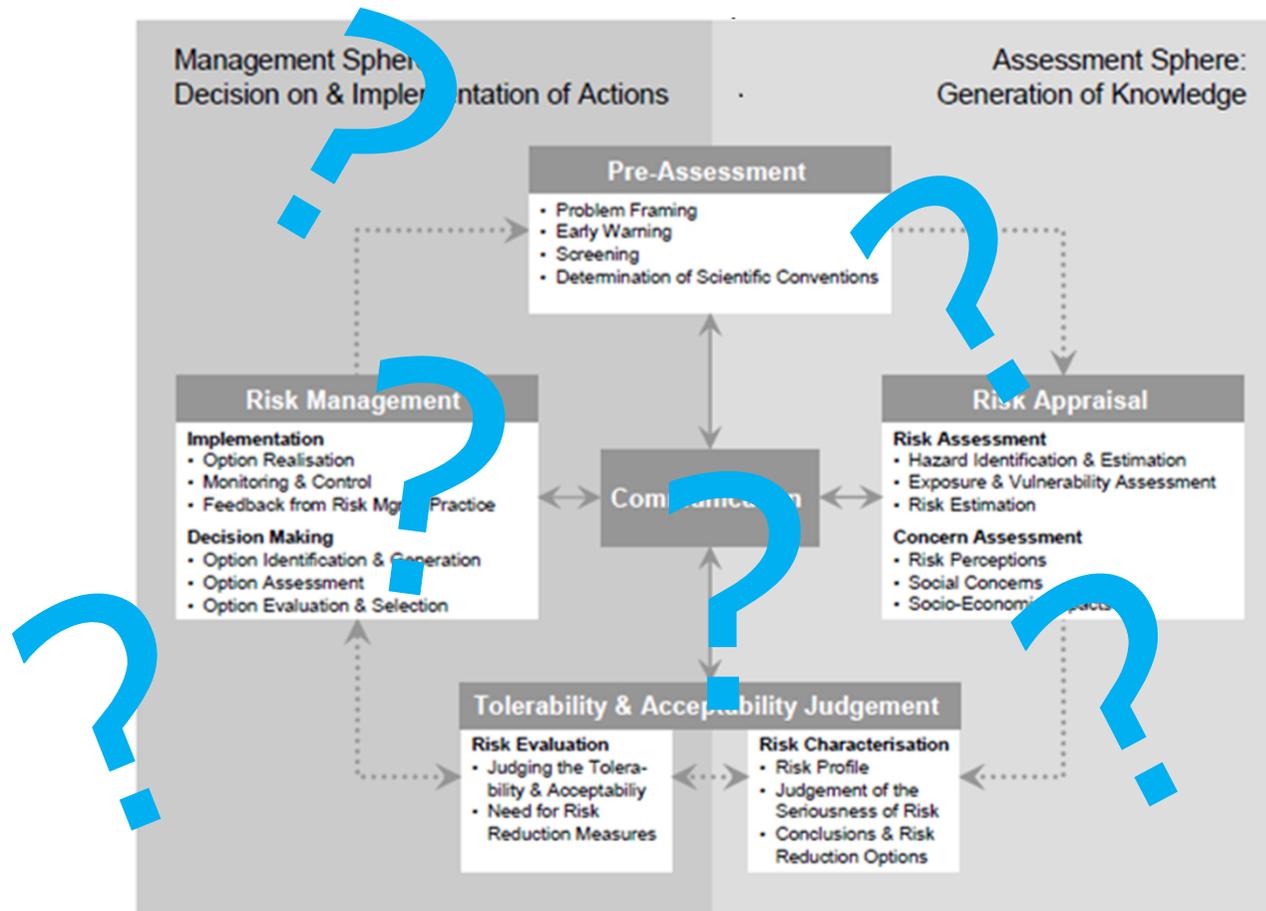

The linear model is culturally embedded as a powerful ideal:

- Radically breaking away from the linear model is difficult
- Scientific authority, financial incentives, expectations from users (PBL examples)
- It structures expectations and divisions of labor

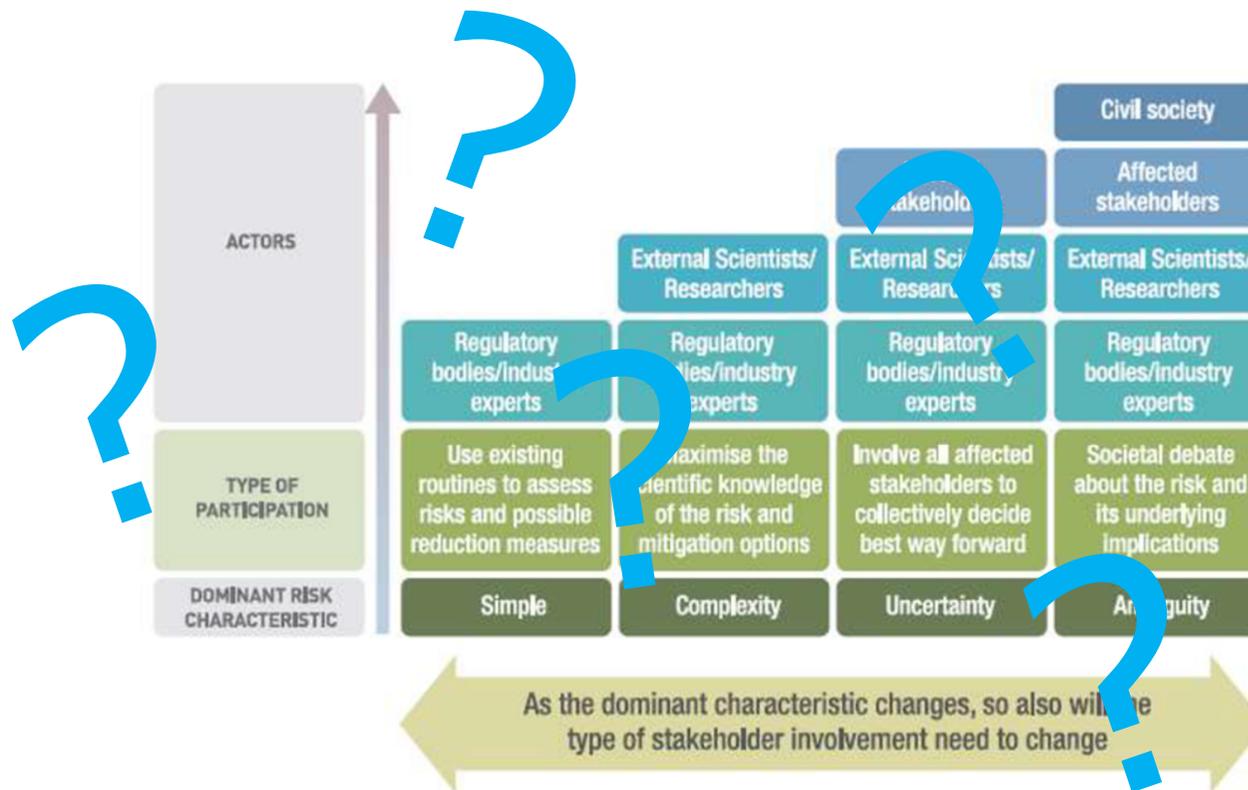

Risk governance & deliberation in practice

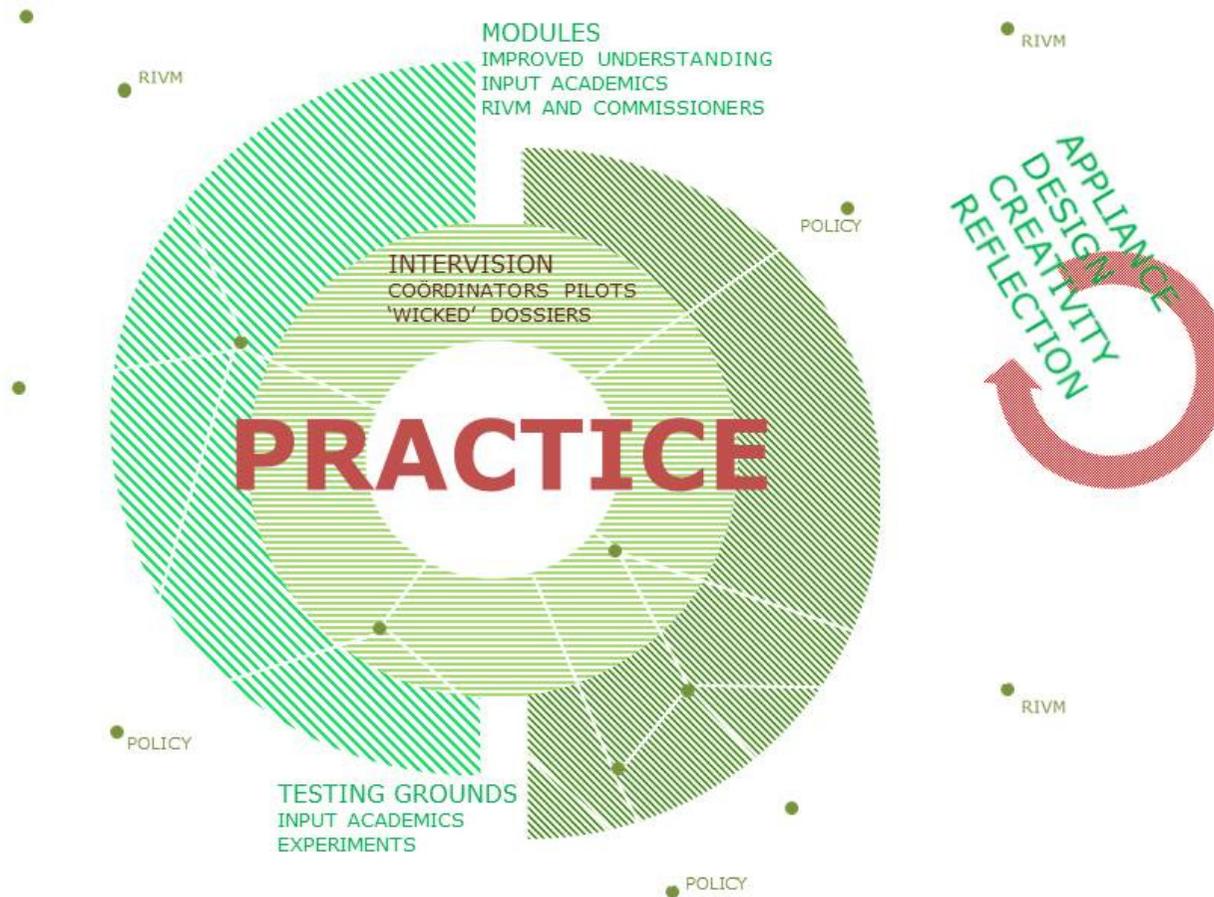

Risk governance & deliberation in practice (2)

Community of practice wicked problems

From best practice to a next practice

- Objective: joint learning about tackling wicked problems; based on 'best practice' to a 'next practice'
- Focus on five case studies. Including managements support. E.g. Antimicrobial Resistance, SafeBBE, synthetic biology
- Moderated by an experienced facilitator of communities of practice
- Consultant science-policy interfaces included
- Dynamic learning and knowledge agenda

From best practice to a next practice (2)

- Modules: risk communication, risk governance, expert roles in policy interfaces, and other needs that might pop up
- Experiments: 'discursive' (policy Beliefs), Joint Fact Finding, Serious gaming, Frame analysis
- Group preliminary consists of RIVM & Policy Makers. Other stakeholders involved later
- Meetings at a location that is attractive to all network partners

Thanks for listening!!

Any questions?
